Citizen science leads to snail rediscovery in Vietnam

by Mike Gaworecki on 8 July 2016

- *Scott Trageser took pictures of several species of invertebrates he encountered on Hon Cau island, part of an archipelago off the southeast coast of Vietnam, and posted them on citizen science website iNaturalist, hoping that an expert somewhere in the world might be able to identify the specimens and benefit from his observations.*

charliev suggested an ID* Improving 8mo

Hemidactylus garnotii
Garnot's House Gecko

* charliev disagrees this is *Hemidactylus frenatus* (Asian House Gecko)

juanda037 commented 8mo

Why *H. garnotii*? 2 days ago you said that other record in exactly the same point was *H. frenatus*:

<https://www.inaturalist.org/observations/9651773>

Currently *H. garnotii* is not officially recorded to Colombia. I think *Hemidactylus* is a complex genus, I've read some literature about this geckos and noticed that their taxonomy is more than just see a bad quality photo and give a name. You should be more conservative.

I know you are working with *Hemidactylus*, but I don't know if you have data from Colombia apart of iNat records. Here in Colombia we have a lot of biological collections that you can find useful in your research, visit us.

Confirming the presence of a fourth species of non-native house gecko of the genus *Hemidactylus* Oken, 1817 (Squamata, Gekkonidae) in Colombia

Juan D. Vásquez-Restrepo¹, Yingyod Lapwong²

¹ Grupo Herpetológico de Antioquia (GHA), Instituto de Biología, Facultad de Ciencias Exactas y Naturales, Universidad de Antioquia, calle 67 No. 53-108, laboratorio 7-121, Medellín, Colombia. ² School of Life Science, Faculty of Science, University of Technology Sydney, Sydney, 15 Broadway, Ultimo NSW 2007, Australia.

Corresponding author: Yingyod Lapwong, yingyod.lapwong@student.uts.edu.au

Abstract

The Indo-Pacific Gecko, *Hemidactylus garnotii* Duméril & Bibron, 1836, is a species of house gecko native to South-east Asia and Pacific Islands. As with many of its congeners, this gecko species has been accidentally introduced to other parts of the world. In January 2018, several photographs of “*H. frenatus*” from Colombia posted in iNaturalist.org, were noticed to have some morphological features related to *H. garnotii*. This discrepancy led us to inspect museum specimens and to confirm the presence of *H. garnotii* for more than a decade in Colombia.

Key words

Hemidactylus garnotii, *Hemidactylus frenatus*, introduced species, range expansion.

New record and range extension of the fiddler crab *Uca princeps* (Smith, 1870) (Brachyura, Ocypodidae) from California, USA

Michael S Rosenberg 

Journal of Crustacean Biology, ruy071, <https://doi.org/10.1093/jcbl/ruy071>

Published: 03 September 2018 [Article history](#) ▾

Abstract

The fiddler crab *Uca princeps* (Smith, 1870) has previously been recorded along the Pacific coast of the Americas from Peru to Mexico. Here we extend its range into the United States, based on photographs posted on the iNaturalist website.

Along the border, 500 miles of desert species

As Trump's wall lurches forward, 'BioBlitz' records the Borderlands' biodiversity.

Maya L. Kapoor | NEWS | April 3, 2018 | From the print edition

One early March morning in southern Arizona's Coronado National Memorial, an uneven line of scientists and amateur naturalists in floppy hats and hiking pants crept up a steep hillside through yellowed grasses and dark shrubs. Plant names – scientific and common – flitted through the cool air, as the group covered the terrain, moving at the pace of lichen.

The dry winter suppressed plant growth, making for challenging botanizing. "Any ideas on this little guy here?" one participant asked, pointing to what appeared to be a leaf emerging from parched soil.

"I just put, 'It's green?'" his companion replied.

Kevin Wettemier uses the iNaturalist app to identify bladder pouts during the Border BioBlitz at Coronado National Memorial on March 3.

City Nature Challenge 2018

April 27 – 30

About

Follow 3657

The City Nature Challenge is an international effort for people to find and document plants and wildlife in cities across the globe. It's a bioblitz-style competition where cities are in a contest against each other to see who can make the most observations of nature, who can find the most species, and who can engage the most people. In

Estadísticas

¿Qué es una observación? Una observación es una o varias fotografías o una grabación de sonidos de un organismo incluyendo la fecha y el lugar donde lo vimos.

 **naturalista** es una red interesada principalmente en fotografías de organismos silvestres y/o en vida libre, tratamos de evitar al máximo fotos de organismos capturados, de zoológicos y de mascotas, pero aceptamos fotografías de organismos en cultivo o cautiverio. Para estos casos debes marcar la casilla de “¿En cautiverio o cultivada?” debajo del nombre.

Para subir fotos

Puedes subir tus fotografías de tres maneras:

Acerca de los nombres

La mayoría de las categorías de organismos tienen nombres comunes en los distintos idiomas. Estos nombres suelen ser reconocibles, fáciles de pronunciar y estables en el tiempo, pero muchos organismos tienen nombres distintos en diferentes lugares, incluso en el mismo idioma, lo que puede dificultar referirse a ellos sin ocasionar confusión. Los científicos solventan este problema usando un nombre...
